Test
HEPATITIS B SURFACE
ANTIGEN
Result
NOT REACTIVE

Comment
Hepatitis B surface antigen (HBsAg) has been accepted as a universal and the most reliable seromarker in case of acute HBV infection due to its appearance about 2-4 weeks before the ALT level becomes abnormal and 2-3 weeks before the onset of symptoms or jaundice as an early detection system for hepatitis infection.
This is only a screening test. All reactive samples should be confirmed by confirmatory tests, clinical history and symptoms.
